**Phyllostachys aurea**

GOLDEN BAMBOO

*Poaceae*

Common Synonyms: none

**Florida Introduction Date:** pre-1870

**Control Methods:**

Chemical: Cut Stem (cut plants and apply 5% Glyphosate, IFAS).

**Useful Resources:**

**Comments:** The most widely cultivated species of bamboo in the US. Fast growing, forming monocultural stands.

**FLEPPC Category:** 2

**FDACS Listed Noxious Weed:** No

**IFAS Assessment**

**USDA Hardiness Zone:** 6a-10b

**Growth Habit:** Bamboo

**Origin:** Southern China

**Description:** Perennial rhizomatous bamboo to 10 m tall with stiff erect stems to 6 cm in diameter, green turning yellowish to brown in maturity. Branches form at nodes, which have a swollen band beneath them. Lower stem crowded with nodes while the upper stem with widely spaced nodes up to 20 cm apart. Stems flattened or grooved on one side above each node. Stem leaf sheaths glabrous, deciduous, margins entire, with two tufts of hairs where sheath intersects the blade. Leaves 1-5 per twig, lanceolate, glabrous above, pubescent along lower midrib, 12 cm long and 2 cm wide. Spikelets sessile, at the ends of leaf branches, seldom flowering in Florida, but a mass flowering event takes place every 50 years or so.

Note: Similar to the native giant cane (Arundinaria gigantea), which lacks the flattened area above each node.

**Habitat:** hardwood forest, pine flatwoods, sinkholes, flood-plains
